

ABSTRACT

A printer system for modifying the printer's output includes a program for the printer which is not compatible with the printer with a managing program for modifying the program. A substitution table substitutes a portion of the program that is not compatible and, a processor in the printer receives the substitution table and modifies the program. The system uses a method of printing with the non-compatible program by providing a program not compatible with the printer and then creating a character substitution table with characters compatible with the printer. The character substitution table is stored in the printer and the stored characters are adapted to the printer with the non-compatible program.
